1.0 GENERAL

Model	TR-936 / TR-966
Frequency Range	26.965 ~ 27.405MHz.
Emission Modes	TR-936 : AM. TR-966 : AM/SSB.
Frequency Control	Phase Lock Loop (PLL) synthesizer.
Frequency Tolerance	± 0.005 %
Frequency Stability	± 0.001 %
Operating Temperature Range	-30°C to +50°C
Microphone	Plug-in dynamic; with push-to-talk switch and coiled cord.
Input Voltage	13.8V DC nominal ±15%.
Current Drain : Transmit (AM full mod.)	<3.5A.
Current Drain : Receiver (Squelched)	<0.5A.
(Max. audio output)	<1.0A.
Antenna Connector	UHF, SO239.
Dimensions	7 7/8"(W) x 9 1/4" (D) x 2 3/8"(H).
Weight	5 lbs.

1.1 TRANSMITTER

RF Power Output	AM : 4W ; SSB : 12W PEP (TR-966).
RF Transmit Modes	AM/SSB (TR-966).
Modulation	High and low level Class B, Amplitude Modulation: AM and SSB (TR-966).
Spurious Emissions	-55 dB.
Carrier Suppression	-55 dB.
Audio Frequency Response	300 to 3000 Hz.
Antenna Impedance	50 Ohms.
Output Indicators	Meter shows relative RF output power. Transmit LED glows red when transmitter is in operation.

1.2 RECEIVER

Sensitivity For 10dB S/N	< 1.0 μV.
Sensitivity For 10dB S/N (SSB)	< 0.5 μV.
IF Frequency	AM : 10.695 MHz 1st IF, 455 KHz 2nd IF.
Image Rejection Ratio	> -65 dB.
Adjacent Channel Selectivity	> -55 dB.
RF Gain Control	45 dB adjustable for optimum signal reception.
Automatic Gain Control (AGC) Figure Of Merit	100 mV for 10 dB Change in Audio Output.
Squelch	Adjustable; threshold less than 0.5 μV.
Noise Blanker	RF type.
Audio Output Power	2W @ 10% THD.
Audio Frequency Response	AM and SSB : 300 to 3000 Hz.
Built-in Speaker	8 Ohms, 4 Watts.
External Speaker (Not Supplied)	8 Ohms; 4 Watts.

2.0 INTRODUCTION

This section explains the basic operating procedures for the TEXAS RANGER TR-936 / TR-966 mobile transceiver.

2.1 CONTROL AND CONNECTIONS

2.1.1 FRONT PANEL

Refer to the above Figure 2-1 for the location of the following controls.

1. MIC GAIN/ANF CONTROL

Adjust the microphone gain in the transmit and PA modes. This controls the gain to the extent that full talk power is available several inches away from the microphone. In the Public Address (PA) mode, the control functions as the volume control. Pull this switch to activate the ANF (Advanced Noise Filter) filter circuit. This feature improves the signal to noise ratio of the receiver's audio when receiving a marginal signal.

2. ON/OFF VOLUME CONTROL

Turn clockwise to apply power to the radio and to set the desired listening level.

3. SQUELCH CONTROL

This switch is used to eliminate background noise being heard through the receiver which can be disturbing when no signal is being received. To use this feature of your radio, gently turn the switch

fully counterclockwise, and then turn clockwise until the background noise is just eliminated. Further clockwise rotation will increase the threshold level and only strong signals will be heard.

4. RF GAIN CONTROL

This control is used to reduce the gain of the RF amplifier under strong signal conditions.

5. SWR CAL CONTROL

This SWR CAL control allows the user to calibrate the SWR meter.

6. S-RF/CAL/SWR SWITCH

In the S-RF position, the meter will indicate the strength of the signal being received, as well as the relative RF output of transmission. When calibrating the SWR meter, you need to put this switch in the CAL position. To use the meter to measure the standing wave ratio, turn the switch to the SWR position.

7. DIMMER CONTROL (TR-936)

This knob controls the level of brightness for the meter lamp and channel display.

MODE CONTROL (TR-966)

This control allows you to select one of the following operating modes: PA/LSB/AM/USB. In the CB position, the PA function is disabled and the unit will transmit and receive on the speaker that is connected. In the PA position, the transceiver acts as a public address amplifier. Before operating in the PA mode, you must first connect an external PA speaker to the PA. SP. Jack on the rear panel.

8. TONE CONTROL (TR-936)

This control changes the tone quality in receive only. In clockwise rotation, treble is increased and in counter clockwise rotation, bass is increased.

CLARIFIER CONTROL (TR-966)

Allows tuning of the receive frequency above or below the channel frequency by up to 1.5 KHz. Although this control is intended primarily to tune in SSB signals, it may be used to optimize AM signals.

9. CHANNEL SELECTOR

This control is used to select a desired transmit and receive channel.

10. FRONT PANEL METER

The Front Panel Meter allows the user to monitor signal strength, RF output power and SWR level.

11. NB/ANL/OFF SWITCH

This is a three position switch. Move the switch all the way up to active the Noise Blanker (NB) and Automatic Noise Limiter (ANL). The Noise Blanker is very effective in eliminating repetitive impulse noise such as ignition interference. When the switch is moved to the middle position, only the Automatic Noise Limiter (ANL) is engaged. Move the switch to the bottom position to turn off the ANL and NB.

12. PA/CB SWITCH (TR-936)

Select the mode of operation. In the PA position, the radio acts as public address amplifier. Your voice will come out of the speaker that is plugged into PA. SP. jack on the rear panel. The radio

does not operate when you are in the PA mode. In the CB position, the PA function is disabled and the radio will transmit and receive on the speaker that is connected.

CH19/OFF (TR-966)

The Channel 19 switch is used for instant access to Channel 19, which is often used by truckers for transmission of traffic and weather conditions.

13. R.B./OFF SWITCH (TR-936)

In the Roger Beep position, the radio transmits an audio tone at the end of your transmission to indicate that transmission has ended. As a courtesy to others, use the Roger Beep only when necessary.

TONE SWITCH HI/LO (TR-966)

This switch changes tone quality in receives only. In LO position, bass is increased and HI position, treble is increased.

14. CH19/OFF SWITCH (TR-936)

The Channel 19 switch is used for instant access to Channel 19, which is often used by truckers for transmission of traffic and weather conditions.

BRIGHT/ DIM SWITCH (TR-966)

This switch controls the level of brightness for the meter lamp and channel display LED.

15. TX/RX LED

The red LED indicates the unit is in the transmit mode. The green LED indicates the unit is in the receive mode.

2.1.2 REAR PANEL

Figure 2-2 represents the location of the following connections:

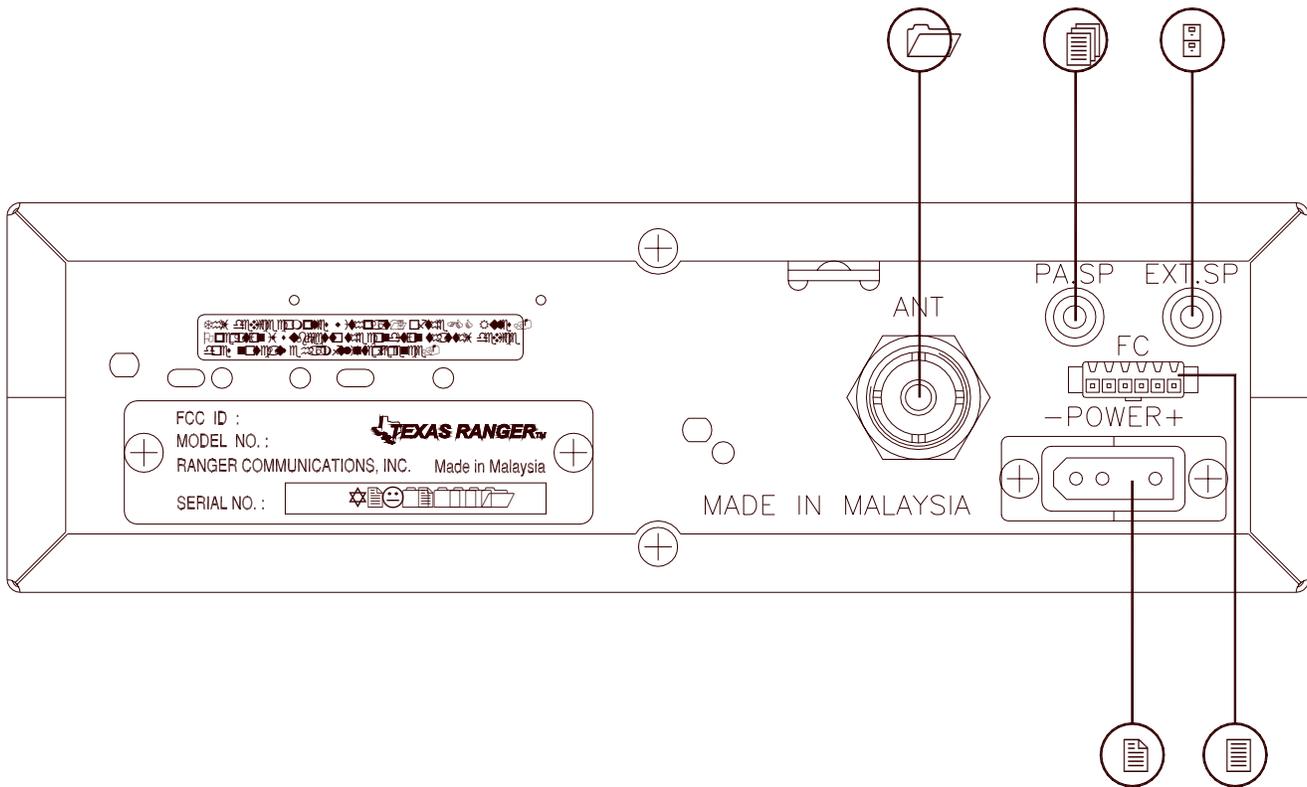

Figure 2-2 Rear Panel

1. ANTENNA

This jack accepts 50 ohms coaxial cable with a PL-259 type plug.

2. POWER

This accepts a 13.8V DC power cable with built-in fuse. The power cord provided with the radio has a black and red wire. The black goes to negative and the red goes to positive.

3. FREQUENCY COUNTER CONNECTOR

This F.C connector is used for the FC-390 external frequency counter which indicates the frequency of the selected channel.

4. PA. SP.

This jack is for PA operation. Before operating, you must first connect a PA speaker (8 ohms, 4W) to this jack.

5. EXT. SP.

This jack accepts a 4 to 8 ohms, 4 watt external speaker. When the external speaker is connected to this jack, the built-in speaker will be disabled.

2.1.3 FREQUENCY CHART

2.2 MICROPHONE

The receiver and transmitter are controlled by the push-to-talk switch on the microphone. Press the switch and the transmitter is activated, release the switch to receive. When transmitting, hold the microphone two inches from your mouth and speak clearly in a normal voice. The radio comes complete with a low impedance (500 ohm) dynamic microphone.

2.3 OPERATION

2.3.1 PROCEDURE TO RECEIVE

1. Be sure that power source, microphone and antenna are connected to the proper connectors before going to the next step.
2. Turn **VOL** knob clockwise to apply power to the radio.
3. Set the **VOL** to a comfortable listening level.
4. Set the **MODE** switch to the desired mode.
5. Listen to the background noise from the speaker. Turn the **SQ (SQUELCH)** knob slowly clockwise until the noise just disappears. The **SQ** is now properly adjusted. The receiver will remain quiet until a signal is actually received. Do not advance the control too far or some of weaker signals will not be heard.
6. Set the **CHANNEL** selector switch to the desired channel.
7. Set the **RF GAIN** control fully clockwise for maximum RF gain.
8. Adjust the **CLARIFIER** control to clarify the SSB signals or to optimize AM signals. (TR-966 only)

2.3.2 PROCEDURE TO TRANSMIT

1. Select the desired channel of transmission
2. Set the **MIC GAIN** control fully clockwise.
3. If the channel is clear, depress the push-to-talk switch on the microphone and speak in a normal voice.

2.4 ALTERNATE MICROPHONES AND INSTALLATION

For best results, the user should select a low impedance dynamic type microphone or a transistorized microphone. Transistorized type microphones have a low output impedance characteristic. The microphones must be provided with a four-lead cable. The audio conductor and its shielded lead comprise two of the leads. The third lead is for transmit control and the fourth is for receiving control. The microphone should provide the functions shown in schematic below (Figure 2-3).

3.0 INTRODUCTION

This section explains the technical theory of operation for the Texas Ranger TR-936 / TR-966 mobile transceiver.

3.1 PLL CIRCUIT

The Phase Lock Loop (PLL) circuit is responsible for developing the receiver's first local oscillator signal and the transmitter's exciter signal. The PLL circuit consists primarily of IC2, IC3, Q25, Q27, Q28 and Q29. The PLL circuit is programmed by the rotary channel switch GPS-0501. The GPS-0501 communicates the correct binary data information to the programmable divider inside of IC3. IC3 then controls the VCO (Voltage Controlled Oscillator), to oscillate on the correct frequency. This signal is fed either into the receiver's first mixer (for receive operation) or the transmitter's mixer (for transmit operation).

3.2 RECEIVER CIRCUIT

The incoming RF signal comes into the radio via the antenna and into the front-end pre-amp, Q17. The RF signal is fed into the dual mosfet mixer circuit of Q18/Q19 and then into the AM/SSB IF section of the receiver (depending on the mode of operation). The signal is then detected by either the AM detector then product detector and then fed to the audio amplifier section of the receiver and finally out to the speaker.

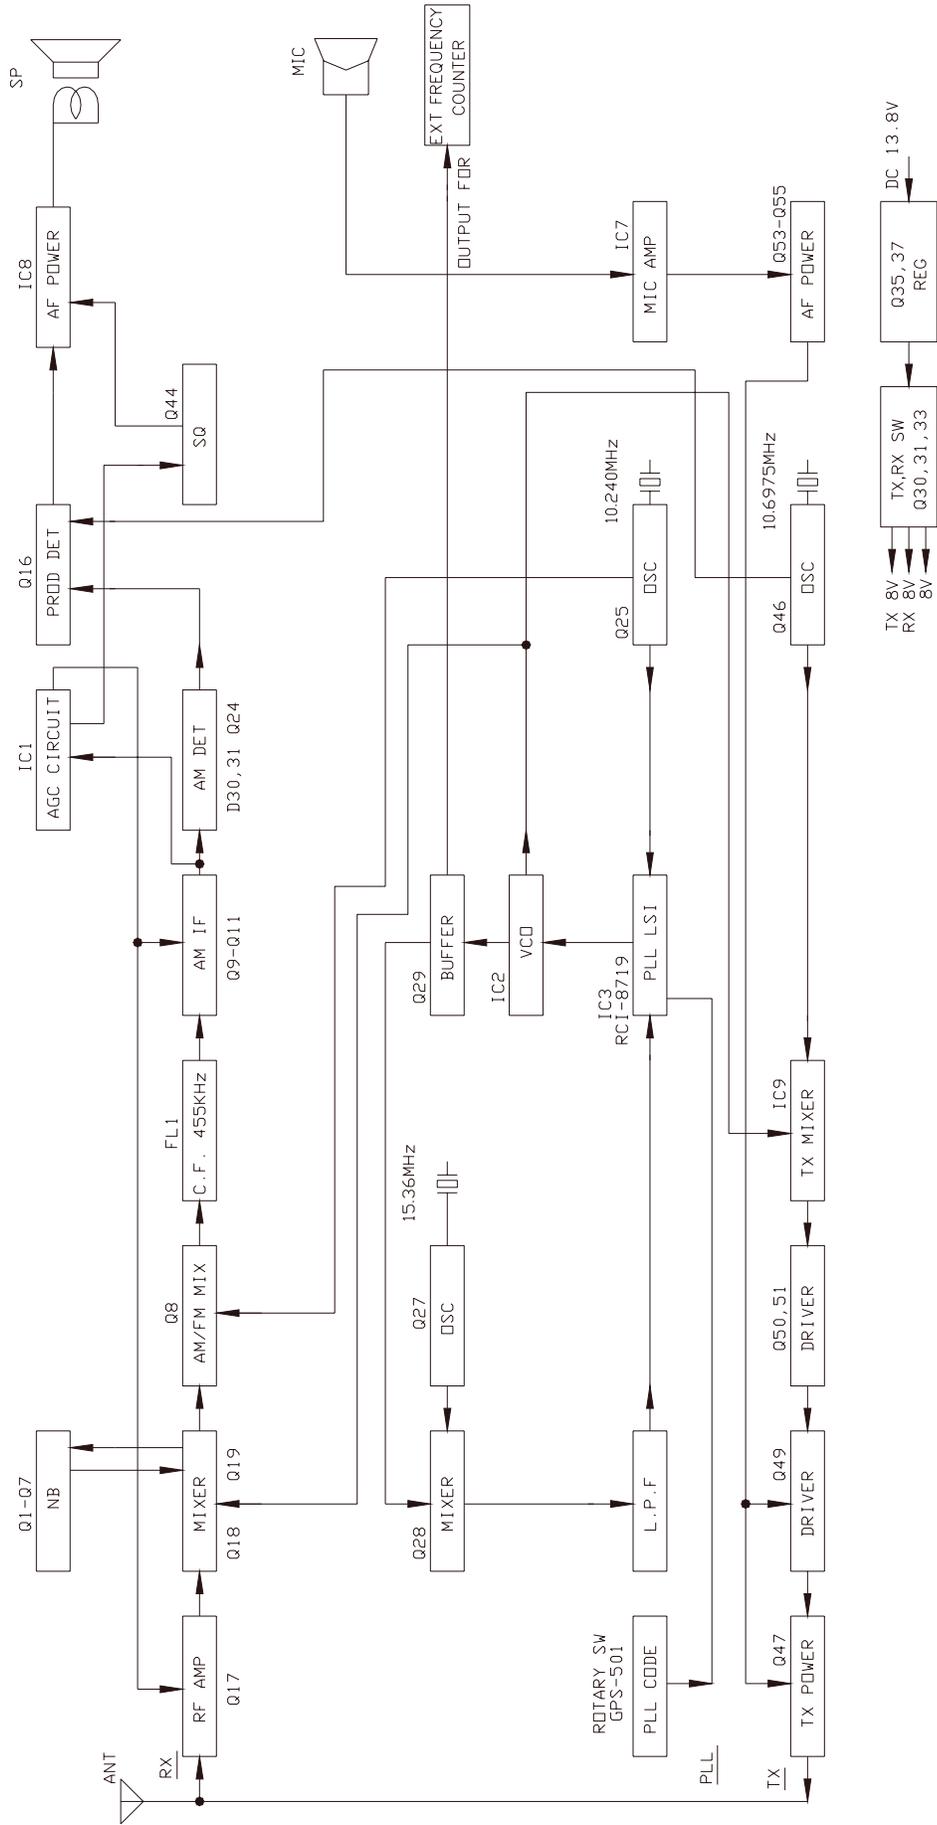

3.3 TRANSMITTER MODULATION CIRCUIT

- (i) The transmitter modulation circuit modulates the low-level RF signal from the PLL exciter circuit with the user's audio voice signal from the microphone. The audio from the microphone is then amplified and fed into the transmit amplifier circuit.
- (ii) If the transceiver is in the AM mode, the AF Power amplifier modulates the last RF amplifier, which produces a true amplitude modulated RF signal.
- (iii) If the transceiver is in the SSB mode, the audio signal is mixed with 10.6975MHz oscillator in IC6. (SSB function only for TR-966)

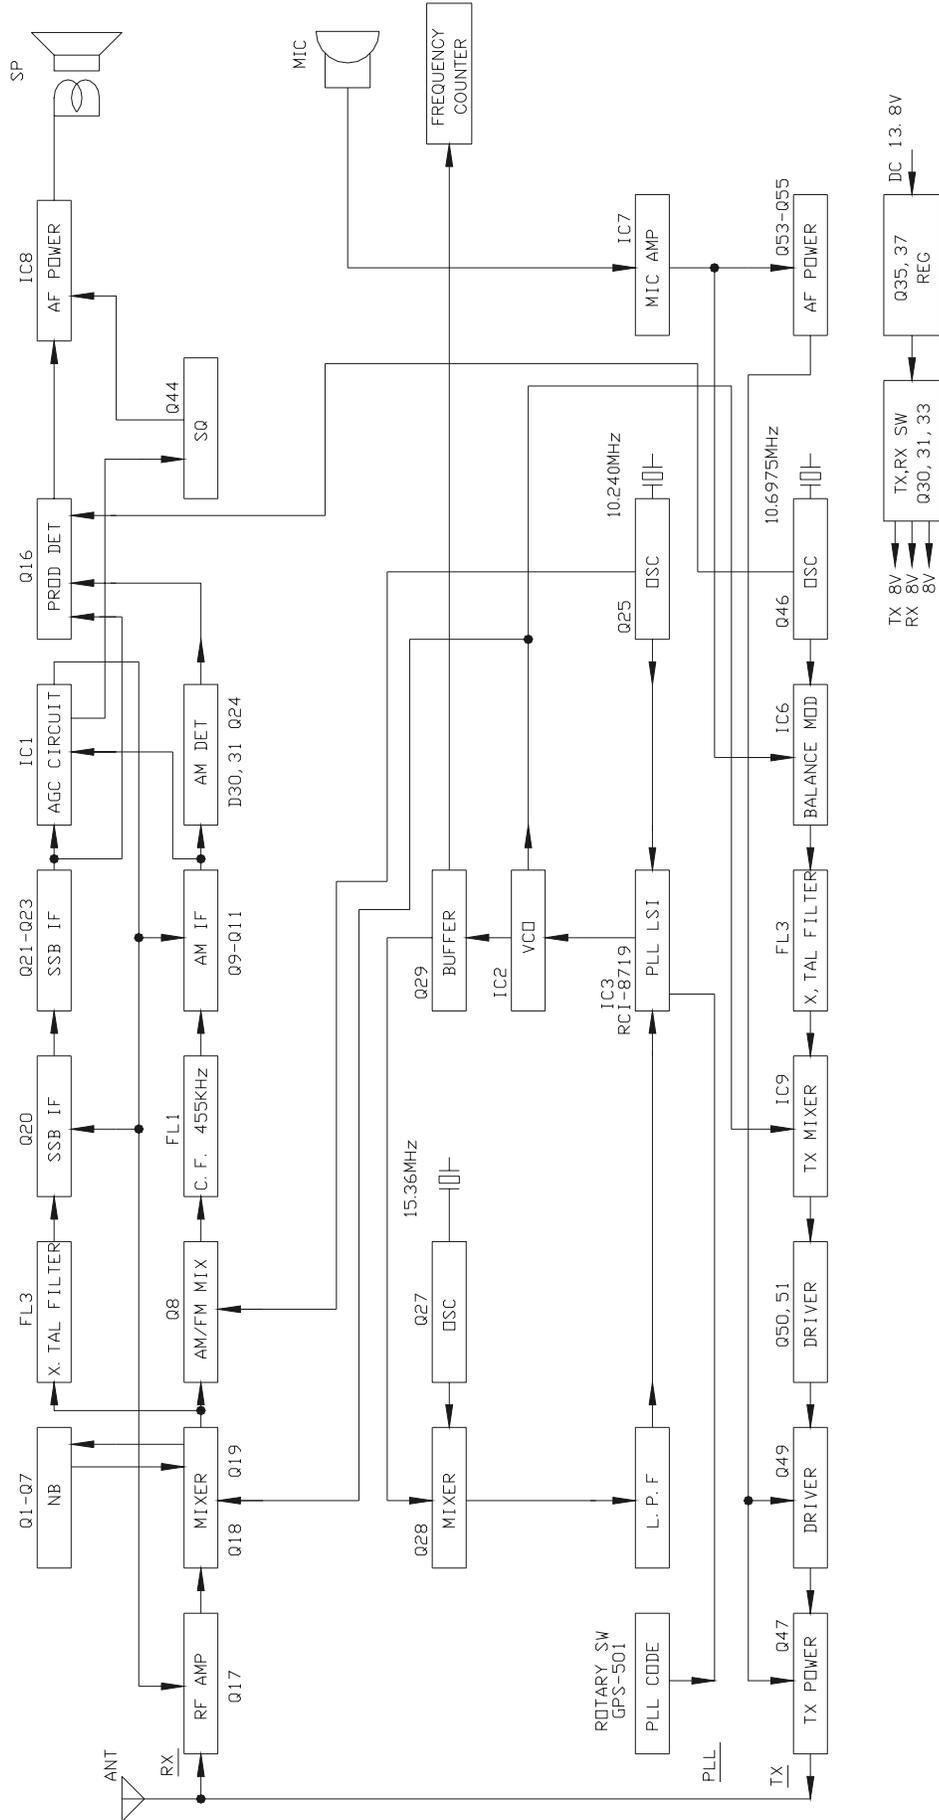

3.4 TRANSMITTER AMPLIFIER CIRCUIT

The transmitter takes the basic exciter signal from the TX mixer and amplifies it through a series of amplifiers consisting of Q50, Q51, Q49 and Q47 where it is sent out to the antenna connector.

5.0 PRECAUTIONS

The inherent quality of the solid-state components used in this transceiver will provide many years of continuous use. Taking the following precautions will prevent damage to the transceiver.

- (i) Never key the transmitter unless an antenna or suitable dummy load is connected to the antenna receptacle.
- (ii) Ensure that the input voltage does not exceed 16 VDC or fall below 11 VDC.
- (iii) During alignment, do not transmit for more than 10 seconds at a time. Transmitting over long periods can cause heat built-up and cause transmitter damage.

5.1 PERIODIC INSPECTION

This unit is aligned at the factory to deliver maximum performance. However, continued performance cannot be expected without periodic inspection and maintenance. Important points to be checked regularly are as follows;

Check Item	Action
Whip antenna (option)	If cracked or broken, replace it.
Coaxial cable	If sheath is cracked, seal with vinyl tape. If immersed with water, install new coaxial cable.
Coaxial & power plug connections	If loosened, reconnect. If corroded, clean contacts.
Battery connection	If corroded, clean power terminals.
Ground terminal	If corroded, clean terminal.

5.2 FUSE REPLACEMENT

To protect the equipment from serious damage, a fuse is provided on the power supply lines. The fuses protect against over voltage / reverse polarity or internal fault of the equipment. If the fuse has blown, first find out the cause of the trouble before replacing it. A fuse rated for more than the transceiver requirement should not be used, since it may permanently damage the equipment. Damage due to over fusing is not covered by the warranty.

6.0 GENERAL

Information on most electrical and mechanical parts is included in the parts list. The reference designators are in alphanumeric order.
